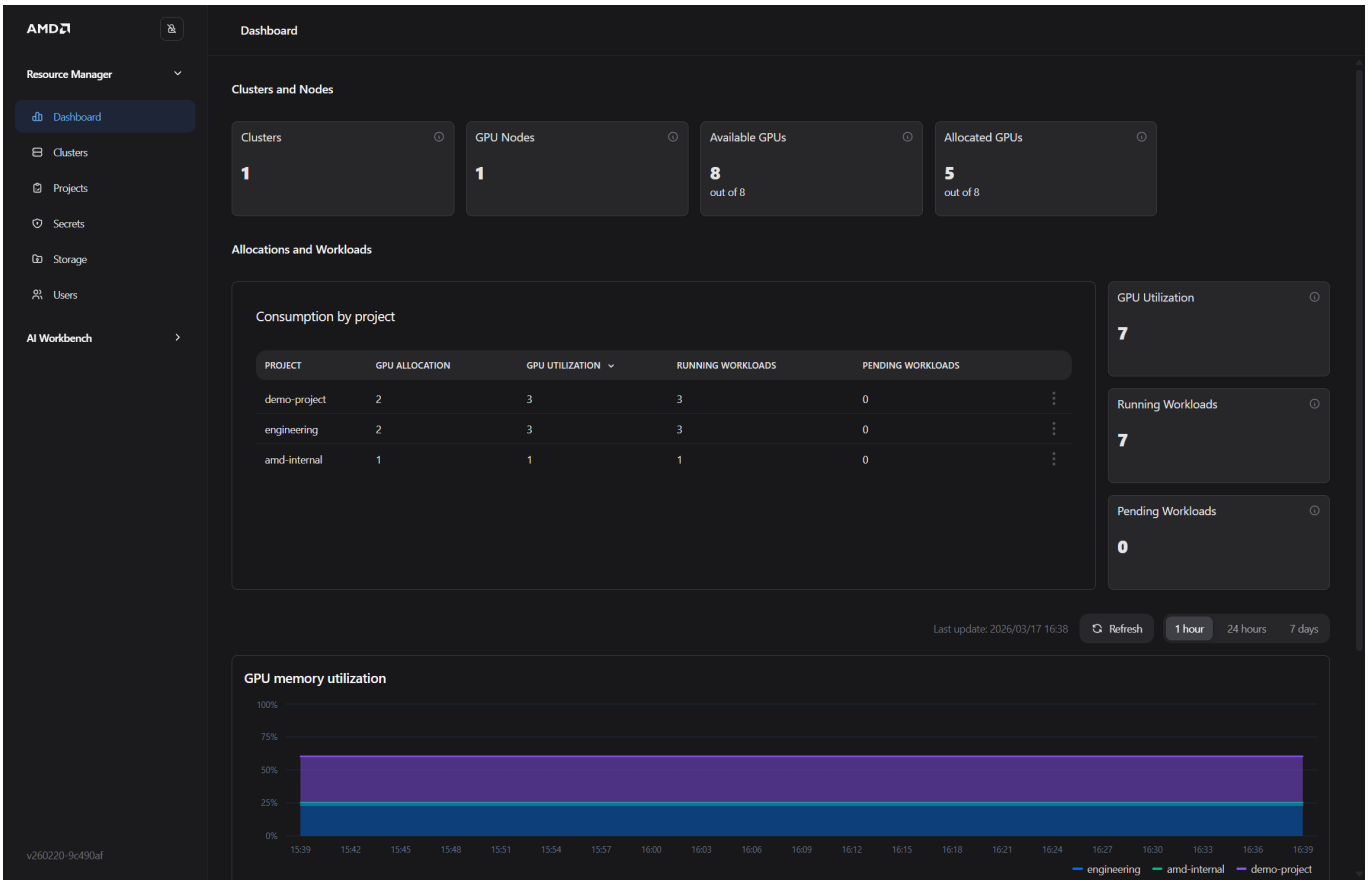
2. AMD Resource Manager

Overview

AMD Resource Manager provides platform administrators with tools to oversee and control the platform's computational resources and user access. Key capabilities include cluster management, monitoring, and maintaining teams' access to computational resources.



Core Concepts

- **Dashboard**: High-level overview of your clusters, resource allocations, and basic utilization statistics
- **Projects**: Create and manage projects, which organize and isolate work within your system. Project settings include user membership, secrets, storage, and quotas
- **Quota**: Guaranteed resource quota for a project to ensure fair resource allocation
- **Storage**: Configurations providing credentials and connectivity information for storage (e.g., S3)
- **Secrets**: Secure information such as API keys or credentials assigned to projects
- **Users**: Manage users, their roles, and their project membership

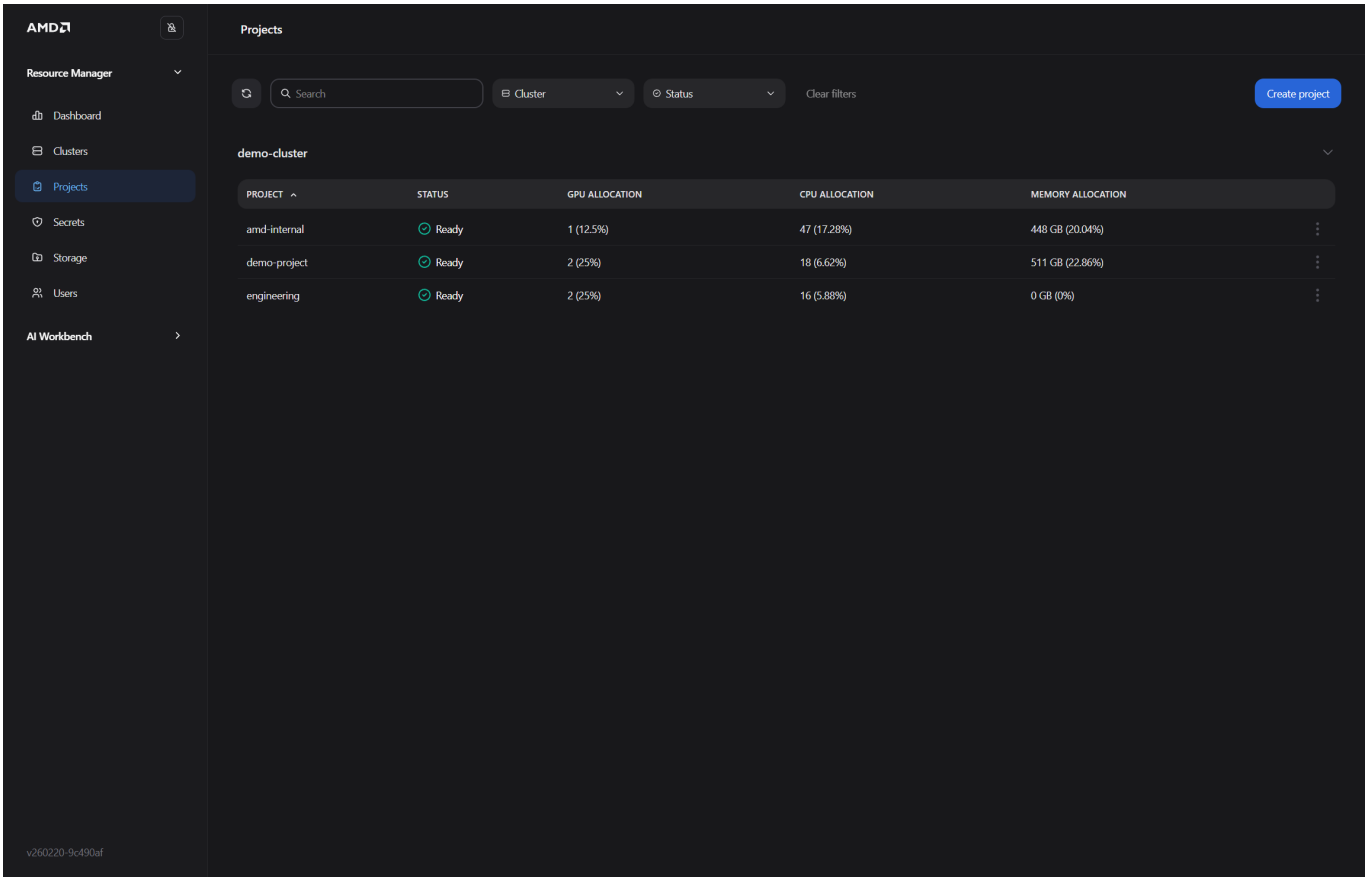
---

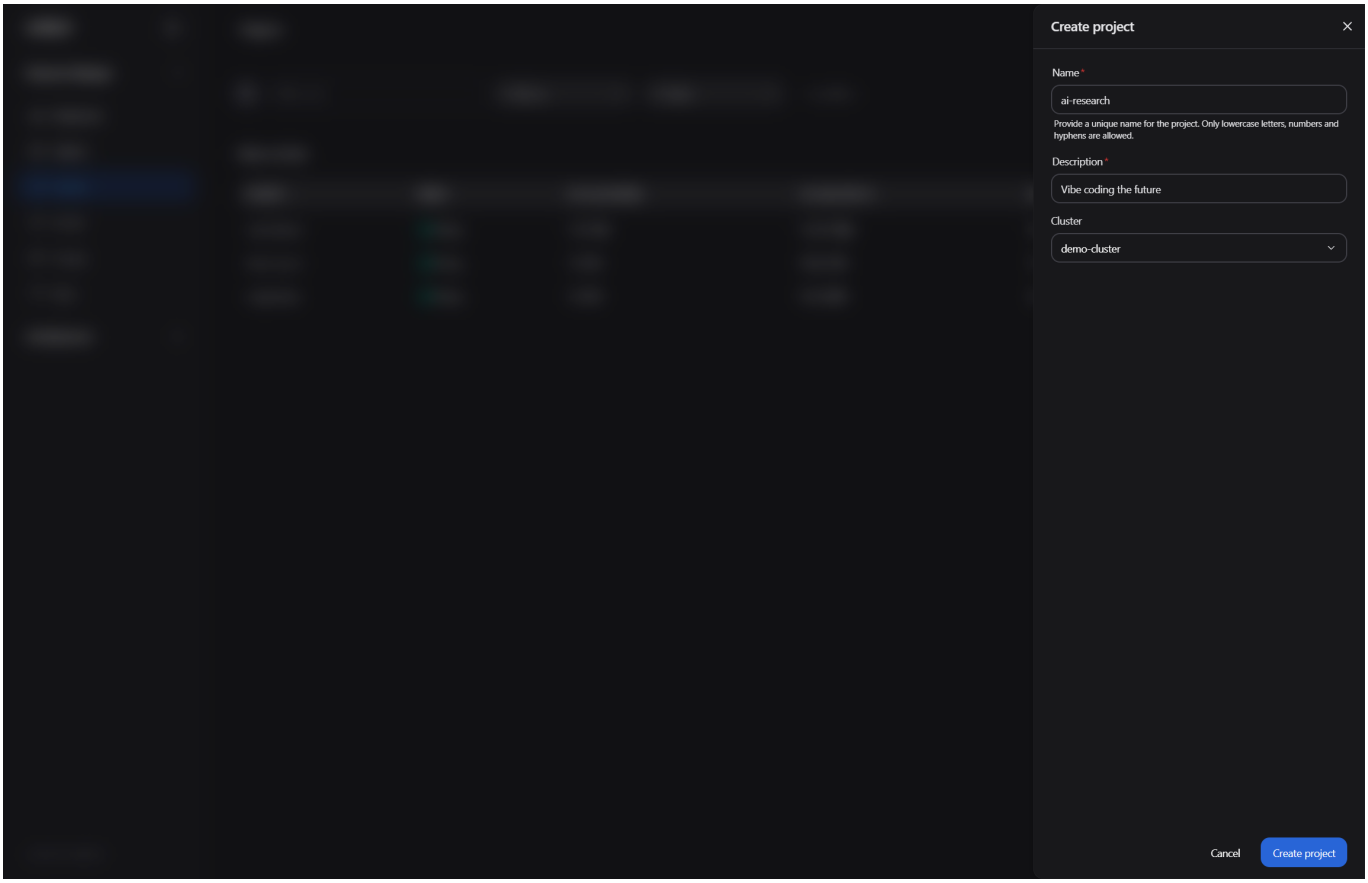
Setting Up a Project

Step 1 — Navigate to Resource Manager

1. From the **Dashboard**, click **Projects** in the left sidebar
2. Click the **Create project** button

3. Enter a project name, an optional description, and select your cluster
4. Click **Create project**





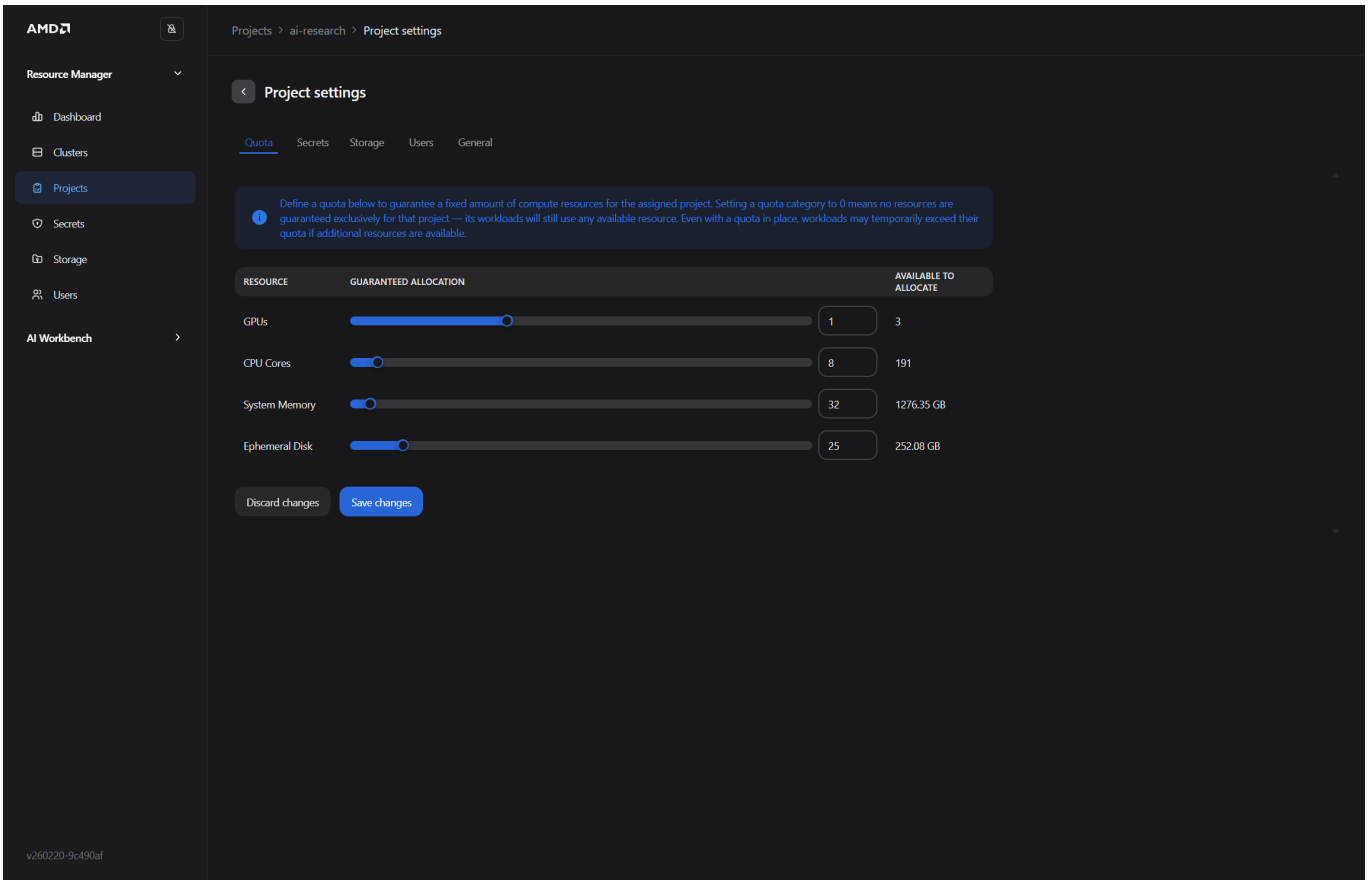
> **Expected outcome:** You are redirected to the **Project settings** page for your new project.

Step 2 — Adjusting Quota

You should now be on the **Project settings** page with the **Quota** tab active. Quotas ensure fair and shared resource allocation across projects.

Set the resource allocation for your project:

1. **GPUs** — Number of GPU devices
2. **CPU Cores** — Number of CPU cores
3. **System Memory** — Memory allocation in GiB
4. **Ephemeral Disk** — Temporary disk space for workloads
5. Click **Save changes**



> **Expected outcome:** A confirmation message appears and your quota settings are saved.

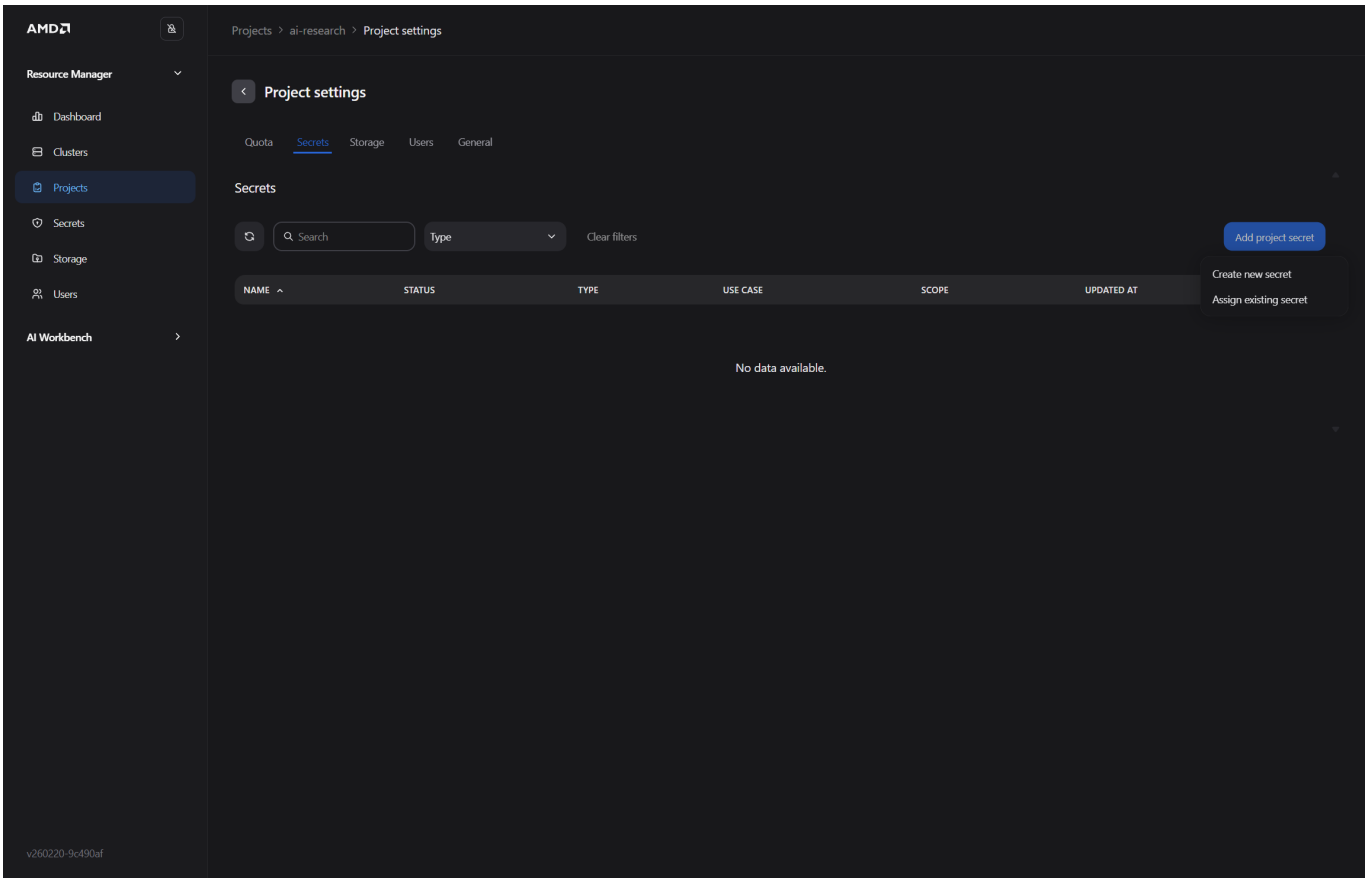
Step 3 — Attaching Storage & Setting Secrets

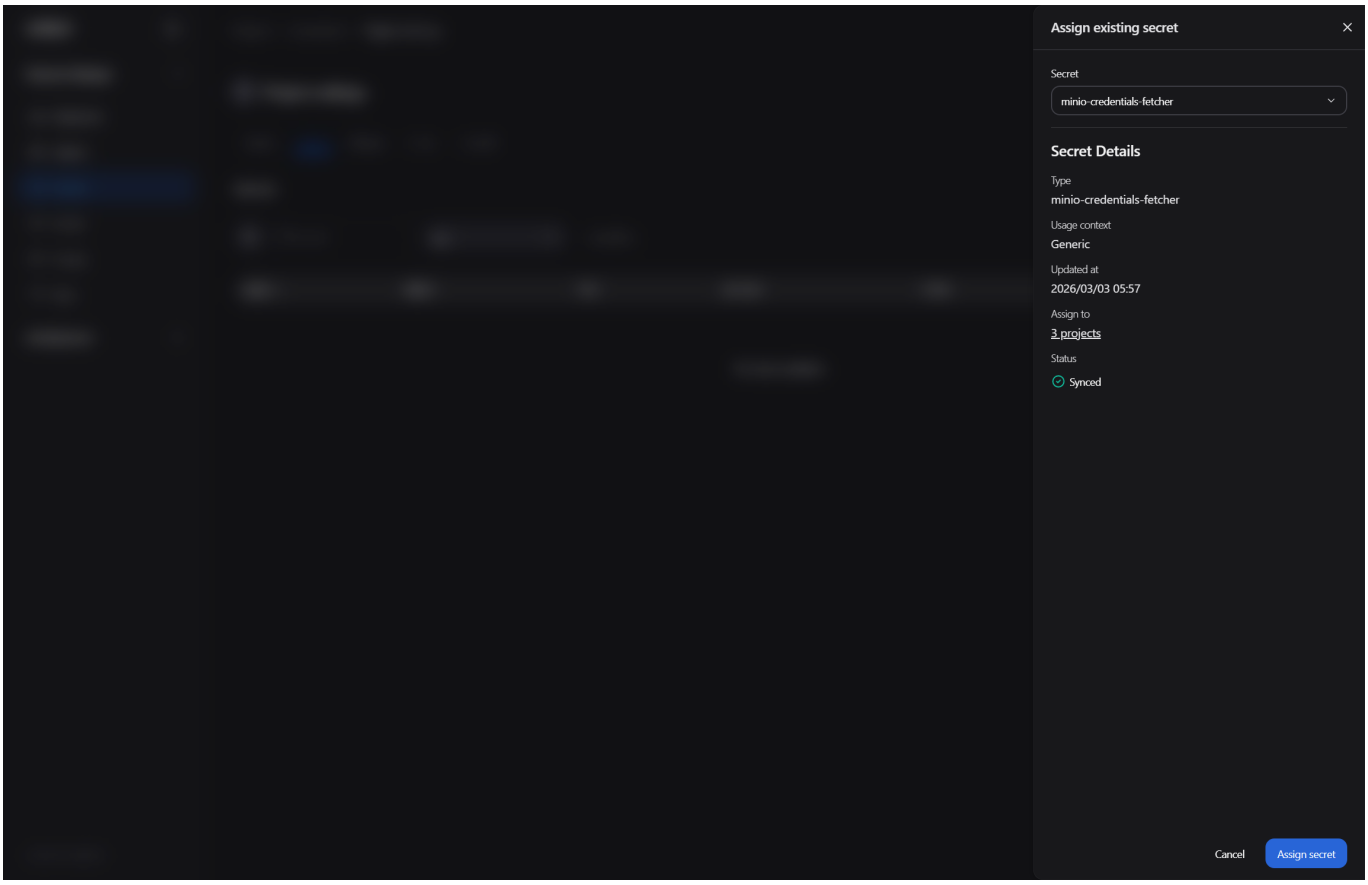
Each project requires a storage configuration to download models and run workloads. During installation, a `minio-credentials-fetcher` secret and a default storage configuration are created automatically. You will assign these to your project now.

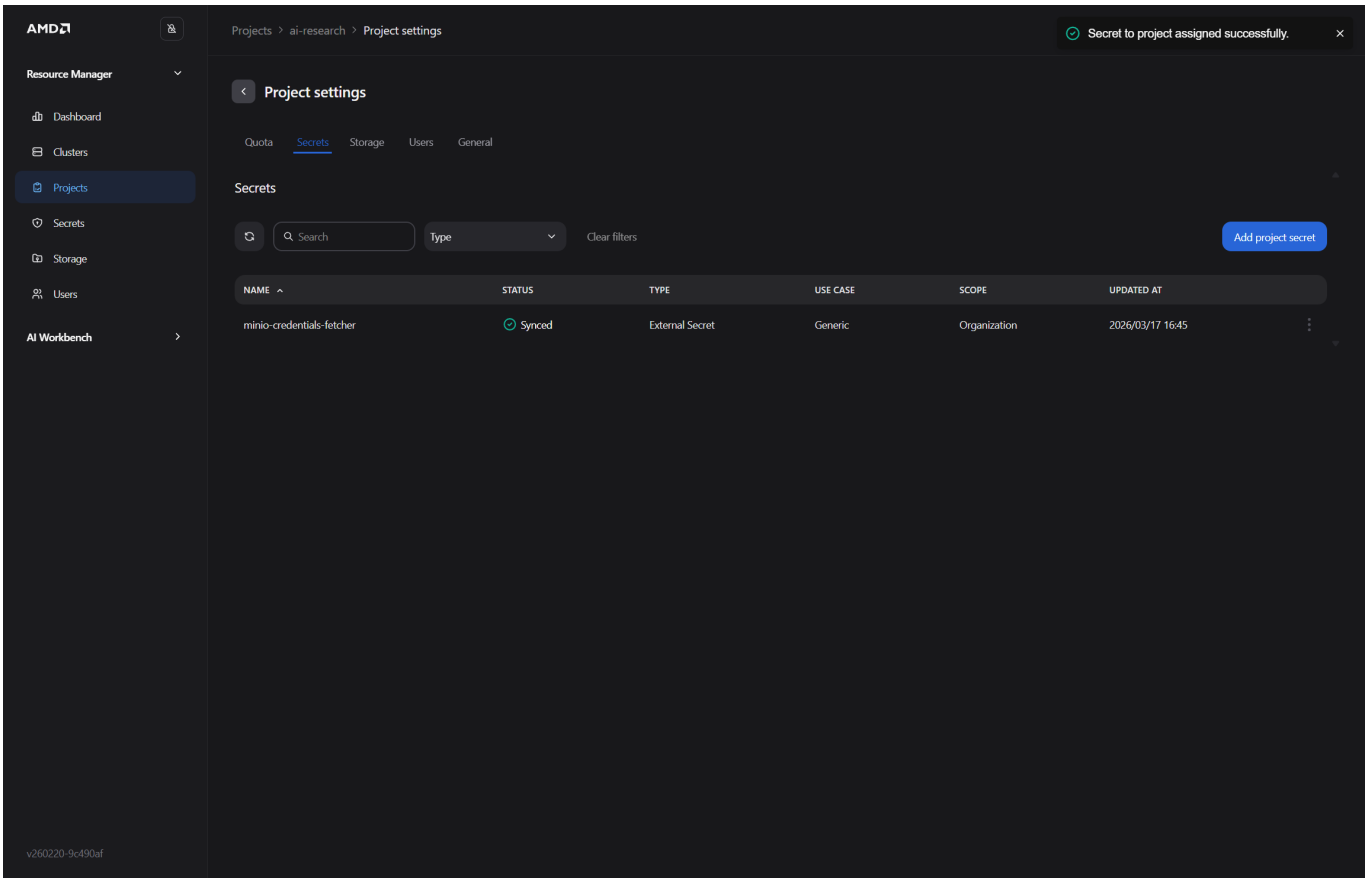
1. Click the **Secrets** tab
2. Click **Add project secret** and select **Assign existing secret**
3. Select **minio-credentials-fetcher** from the **Secret** drop-down menu
4. Click **Assign secret**
5. Click **Add project secret** again and select **Create new secret**
6. Enter a secret name such as `hugging-face-token`

7. Add a key/value pair (for example, key: `HF_TOKEN`, value: your Hugging Face access token)
8. Click **Create secret**

> **Why this is needed:** The Hugging Face token is required for accessing gated models and some finetuning workflows in AMD AI Workbench.







> **Expected outcome:** Both `minio-credentials-fetcher` and your Hugging Face token secret appear in the project's secrets list.

> **Troubleshooting:** If `minio-credentials-fetcher` does not appear in the drop-down, the platform installation may not have completed successfully. See the Troubleshooting section.

Step 4 — Adding Users to the Project

Users must be added to a project before they can access its resources and run workloads.

1. Click the **Users** tab
2. Click the **Add Member** button
3. Select yourself (and any other desired users) from the **Users** drop-down menu
4. Click **Add to project**

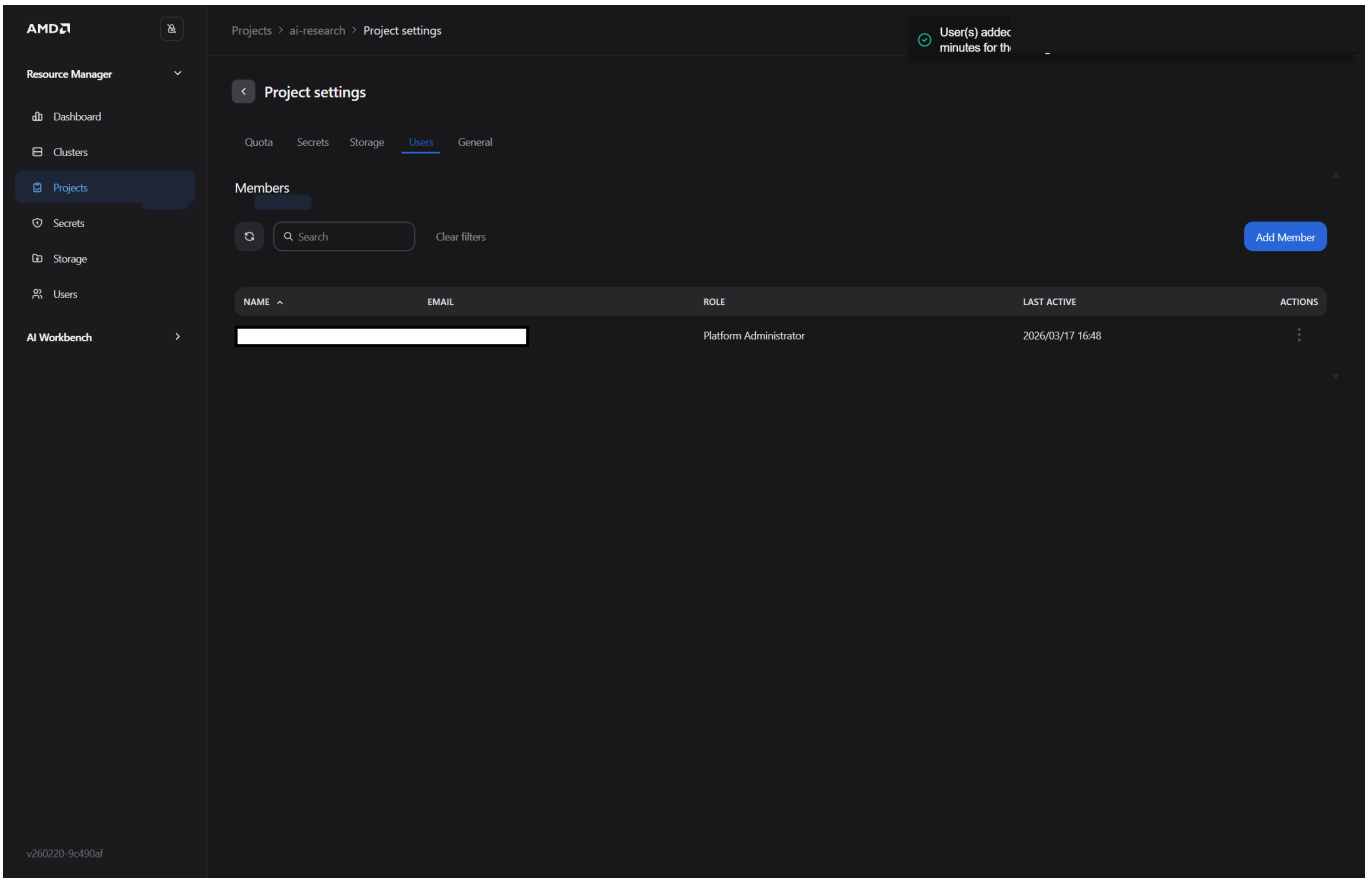
Add to project



> **Expected outcome:** The selected user(s) appear in the project's member list. Your project is now configured and ready to use.

Next: Proceed to AMD Workbench to deploy a model.
